ターゲット情報

機能

Adapter protein implicated in the regulation of a large spectrum of both general and specialized signaling pathways. Binds to a large number of partners, usually by recognition of a phosphoserine or phosphothreonine motif. Binding generally results in the modulation of the activity of the binding partner. When bound to KRT17, regulates protein synthesis and epithelial cell growth by stimulating Akt/mTOR pathway. May also regulate MDM2 autoubiquitination and degradation and thereby activate p53/TP53.

p53-regulated inhibitor of G2/M progression.

組織特異性

Present mainly in tissues enriched in stratified squamous keratinizing epithelium.

配列類似性

Belongs to the 14-3-3 family.

翻訳後修飾

Ubiquitinated. Ubiquitination by RFFL induces proteasomal degradation and indirectly regulates p53/TP53 activation.

細胞内局在

Cytoplasm. Nucleus. Secreted. May be secreted by a non-classical secretory pathway.
