ターゲット情報

機能

One of the major glycoproteins of thymocytes and T lymphocytes. Plays a role in the physicochemical properties of the T-cell surface and in lectin binding. Presents carbohydrate ligands to selectins. Has an extended rodlike structure that could protrude above the glycocalyx of the cell and allow multiple glycan chains to be accessible for binding. Is a counter receptor for SN/Siglec-1 (By similarity). During T-cell activation is actively removed from the T-cell-APC (antigen-presenting cell) contact site thus suggesting a negative regulatory role in adaptive immune response.

組織特異性

Cell surface of thymocytes, T-lymphocytes, neutrophils, plasma cells and myelomas.

翻訳後修飾

Glycosylated; has a high content of sialic acid and O-linked carbohydrate structures.

細胞内局在

Membrane.

Overlay histogram showing peripheral blood lymphocytes stained with ab21853 (red line). The cells incubated in 1x PBS / 10% normal goat serum / 0.3M glycine to block non-specific protein-protein interactions. The cells were then incubated with the antibody (ab21853, 0.5 $\mu\text{g}/1 \times 10^6$ cells) for 30 min at 22°C. Isotype control antibody (black line) was mouse IgG1 FITC (2 $\mu\text{g}/1 \times 10^6$ cells) for 30 min at 22°C. Acquisition of >5,000 events was performed.
