ターゲット情報

機能	Mitochondrial GTPase that catalyzes the GTP-dependent ribosomal translocation step during translation elongation. During this step, the ribosome changes from the pre-translocational (PRE) to the post-translocational (POST) state as the newly formed A-site-bound peptidyl-tRNA and P-site-bound deacylated tRNA move to the P and E sites, respectively. Catalyzes the coordinated movement of the two tRNA molecules, the mRNA and conformational changes in the ribosome. Does not mediate the disassembly of ribosomes from messenger RNA at the termination of mitochondrial protein biosynthesis.
パスウェイ	Protein biosynthesis; polypeptide chain elongation.
関連疾患	Defects in GFM1 are the cause of combined oxidative phosphorylation deficiency type 1 (COXPD1) [MIM:609060]. It leads to early fatal progressive hepatoencephalopathy.
配列類似性	Belongs to the GTP-binding elongation factor family. EF-G/EF-2 subfamily.
細胞内局在	Mitochondrion.
