ターゲット情報

関連性

Cytoskeletal protein required for organization of normal actin cytoskeleton. Roles in establishing cell morphology, motility, cell adhesion and cell-extracellular matrix interactions in a variety of cell types. May function as a scaffolding molecule with the potential to influence both actin polymerization and the assembly of existing actin filaments into higher-order arrays. Binds to proteins that bind to either monomeric or filamentous actin. Localizes at sites where active actin remodeling takes place, such as lamellipodia and membrane ruffles. Different isoforms may have functional differences. Involved in the control of morphological and cytoskeletal changes associated with dendritic cell maturation. Involved in targeting ACTN to specific subcellular foci (from SwissProt).

細胞内局在

Cytoplasm, cytoskeleton. Note: Localizes to stress fibers and Z disks. Cell junction, focal adhesion. Cell projection, ruffle. Cell projection, lamellipodium.

Developed using the ECL technique.

Predicted band size: 122 kDa

Observed band size: 122 kDa

Additional bands at: 55 kDa. We are unsure as to the identity of these extra bands.

An additional band of 55kDa was consistently observed, however this band was not blocked by the immunizing peptide and it is therefore a non-specific signal.
