ターゲット情報

機能 Thought to form a receptor-activated non-selective calcium permeant cation channel. Probably is

operated by a phosphatidylinositol second messenger system activated by receptor tyrosine kinases or G-protein coupled receptors. Activated by diacylglycerol (DAG) in a membrane-delimited fashion, independently of protein kinase C. Seems not to be activated by intracellular

calcium store depletion.

組織特異性 Expressed primarily in placenta, lung, spleen, ovary and small intestine. Expressed in podocytes

and is a component of the glomerular slit diaphragm.

関連疾患 Defects in TRPC6 are the cause of focal segmental glomerulosclerosis type 2 (FSGS2)

[MIM:603965]. A renal pathology defined by the presence of segmental sclerosis in glomeruli and resulting in proteinuria, reduced glomerular filtration rate and edema. Renal insufficiency often progresses to end-stage renal disease, a highly morbid state requiring either dialysis

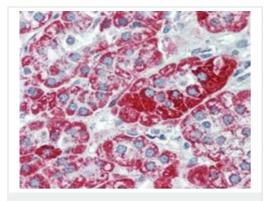

therapy or kidney transplantation.

配列類似性 Belongs to the transient receptor (TC 1.A.4) family. STrpC subfamily. TRPC6 sub-subfamily.

Contains 4 ANK repeats.

細胞内局在 Membrane.

Immunohistochemistry (Formalin/PFA-fixed paraffinembedded sections) - Anti-TRPC6 antibody
[3F2.H10.F2] (ab105845)

ab105845 at 2.5 µg/ml staining TRPC6 in Human adrenal (cortex) tissue by Immunohistochemistry Formalin-fixed, Paraffin-embedded tissue.

The image shows strong staining with minimal background staining. The image shows the localization of antibody as the precipitated red signal, with a hematoxylin purple nuclear counterstain.

Predicted band size: 106 kDa

Western blot analysis of ab105845 with mouse kidney (10ug) at the dilution 1/1000.Secondary antibody (DyLight™ 649 donkey anti-mouse) was used at the dilution 1/20000
