Human bladder tissue lysate (transitional cell carcinoma) - soluble fraction (female, 57 years) ab44603

製品の概要

製品名 Human bladder tissue lysate (transitional cell carcinoma) - soluble fraction (female, 57 years)

特記事項 Tissue: Urinary bladder Location: Right wall of bladder in region of trigone. Diagnosis: Transitional cell carcinoma Stage: I. T_{1b}N_xM₀. Grade: Not graded Sex: Female Age: 57 years
Gross findings: Thickness of the bladder wall 80 x 55 mm in the region of trigone.

This product belongs to a range of individual sets of lysates that were extracted from very specific tissues and are gender-, cancer subtype-, tumor grade- and cellular morphology-specific. They allow for consistency, reproducibility, and comparative studies from experiment to experiment, due to the existence of specific (matched) lysates that can be used as controls. Two extractions from each tissue were performed, extraction 1 yielding the soluble protein fraction and extraction 2 the insoluble protein fraction.
