WB

Use a concentration of 1 μ g/ml. Predicted molecular weight: 53 kDa. Good results were obtained when blocked with 5% non-fat dry milk in 0.05% PBS-T.

ターゲット情報

機能 Guanine nucleotide exchange factor (GEF) which may activate RAB8A and RAB8B. Promotes the exchange of GDP to GTP, converting inactive GDP-bound Rab proteins into their active GTP-bound form. Mediates the release of GDP from RAB8A and RAB8B but not from RAB3A or RAB5. Modulates actin organization and promotes polarized transport of RAB8A-specific vesicles to the cell surface. Together with RAB11A, RAB8A, the exocyst complex, PARD3,

initiation sites (AMIS), apical surface formation and lumenogenesis.

組織特異性 Expressed in brain, kidney, heart, pancreas and placenta. Not detected in skeletal muscle or

liver.

配列類似性 Belongs to the SEC2 family.

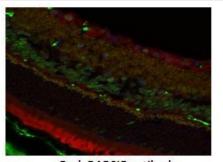

細胞内局在 Cytoplasm. Nucleus. Cytoplasm, cytoskeleton. Cell projection, lamellipodium. Predominantly

cytoplasmic but a small proportion colocalizes with SSX2 in the nucleus. Activation of protein kinase C results in redistribution to the periphery of lamellipodia. In the cytoskeleton, localizes to

PRKCI, ANXA2, CDC42 and DNMBP promotes transcytosis of PODXL to the apical membrane

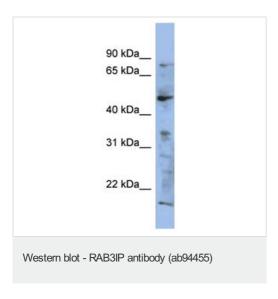

cortical actin.
