ターゲット情報

機能	Is thought to be involved in the organization of the cytomatrix at the nerve terminals active zone (CAZ) which regulates neurotransmitter release. Seems to act through binding to ERC2/CAST1. Essential in regulated neurotransmitter release from a subset of brain glutamatergic synapses. Involved in the formation of the retinal photoreceptor ribbon synapses.
組織特異性	Exclusively expressed in brain.
翻訳後修飾	Myristoylated. The N-terminal myristoylation is not sufficient for presynaptic localization.
細胞内局在	Cytoplasm. Cell junction > synapse > synaptosome. Cytoplasm > cytoskeleton. Localized to the active zone of presynaptic density.

IHC-P image of Bassoon/BSN staining on mouse cerebellum sections using ab82958 (1:1500). The sections were deparaffinized and subjected to heat mediated antigen retrieval using HEIR. The sections were blocked using 1% BSA for 10 mins at 21°C. ab82958 was diluted 1:1500 and incubated with the sections for 2 hours at 21°C. The secondary antibody used was goat polyclonal to mouse IgG conjugated to Biotin (1:200).

This image was generated using the ascites version of the product.

IHC-P image of Bassoon/BSN staining on rat cerebellum sections using ab82958 (1:1000). The sections were deparaffinized and subjected to heat mediated antigen retrieval using citric acid. The sections were blocked using 1% BSA for 10 mins at 21°C. ab82958 was diluted 1:1000 and incubated with the sections for 2 hours at 21°C. The secondary antibody used was goat polyclonal to mouse IgG conjugated to biotin (1:200).

Immunohistochemistry (Formalin/PFA-fixed paraffin-embedded sections) - Anti-Bassoon/BSN antibody [SAP7F407] (ab82958)

IHC image of Bassoon/BSN staining in Human normal cerebral cortex formalin fixed paraffin embedded tissue section, performed on a Leica Bond™ system using the standard protocol F. The section was pre-treated using heat mediated antigen retrieval with sodium citrate buffer (pH6, epitope retrieval solution 1) for 20 mins. The section was then incubated with ab82958, 5µg/ml, for 15 mins at room temperature and detected using an HRP conjugated compact polymer system. DAB was used as the chromogen. The section was then counterstained with haematoxylin and mounted with DPX.

This image was generated using the ascites version of the product.

For other IHC staining systems (automated and non-automated) customers should optimize variable parameters such as antigen retrieval conditions, primary antibody concentration and antibody incubation times.
